

1 How do we check entailments?

1. Create set of “axioms” based on the program and the entailment to check
 - (a) Datatype Declarations
 - Enumeration types: Variables, Classes, Fields
 - ADT: Path
 - (b) Function Declarations
 - Declared: path-equivalence, instance-of, instantiated-by
 - Defined recursively: substitute
 - (c) Calculus rules as all quantified formulas
 - Static Rules: C-Refl, C-Class, C-Subst
 - Template Rules: C-Prog
 - (d) Assert entailment to be checked: $c_1, \dots, c_n \vdash c \Rightarrow \neg(c_1 \wedge \dots \wedge c_n \rightarrow c)$
2. Obtain Solution: Does the entailment contradict the rules?
 - If unsat: valid/correct entailment.
 - If sat: invalid entailment.

1.1 General First-Order Encoding Template

- | | |
|--|------|
| Variable (...) | (1) |
| Field (...) | (2) |
| Class (...) | (3) |
| Path ((Variable) (Path.Field)) | (4) |
| $\equiv : \text{Path} \times \text{Path} \rightarrow \mathcal{B}$ | (5) |
| $:: : \text{Path} \times \text{Class} \rightarrow \mathcal{B}$ | (6) |
| $\text{.cls} \equiv : \text{Path} \times \text{Class} \rightarrow \mathcal{B}$ | (7) |
| $_ \llbracket \mapsto \rrbracket : \text{Path} \times \text{Variable} \times \text{Path} \rightarrow \text{Path}$ | (8) |
| $\forall p : \text{Path}. p \equiv p$ | (9) |
| $\forall a : \mathcal{B}, p : \text{Path}, c : \text{Class}.$ | (10) |
| $(a \rightarrow p.\text{cls} \equiv c) \rightarrow (a \rightarrow p :: c)$ | (11) |
| $\forall a : \mathcal{B}, p : \text{Path}, q : \text{Path}, r : \text{Path}, s : \text{Path}, x : \text{Variable}.$ | (12) |
| $(a \rightarrow p \llbracket x \mapsto r \rrbracket \equiv q \llbracket x \mapsto r \rrbracket \wedge (a \rightarrow s \equiv r)) \rightarrow$ | (13) |
| $(a \rightarrow p \llbracket x \mapsto s \rrbracket \equiv q \llbracket x \mapsto s \rrbracket)$ | (14) |
| $\forall a : \mathcal{B}, p : \text{Path}, c : \text{Class}, r : \text{Path}, s : \text{Path}, x : \text{Variable}.$ | (15) |
| $(a \rightarrow p \llbracket x \mapsto r \rrbracket :: c \wedge (a \rightarrow s \equiv r)) \rightarrow$ | (16) |
| $(a \rightarrow p \llbracket x \mapsto s \rrbracket :: c)$ | (17) |
| $\forall a : \mathcal{B}, p : \text{Path}, c : \text{Class}, r : \text{Path}, s : \text{Path}, x : \text{Variable}.$ | (18) |
| $(a \rightarrow p \llbracket x \mapsto r \rrbracket.\text{cls} \equiv c \wedge (a \rightarrow s \equiv r)) \rightarrow$ | (19) |
| $(a \rightarrow p \llbracket x \mapsto s \rrbracket.\text{cls} \equiv c)$ | (20) |
| $\forall a : \mathcal{B}, p : \text{Path}. (a \rightarrow \bigwedge _) \rightarrow (a \rightarrow p :: _)$ | (21) |

- (1), (2) and (3): Enumeration types, will be instantiated based on the program context.
- (4): Path datatype. A path is either a variable or a path followed by a field.
- (5), (6) and (7): Signatures of constraint predicates.
- (8): Signature of path substitution, $p_{\llbracket x \mapsto q \rrbracket}$ can be read as substitute x in p with q .
- (9): Encoding for rule C-Refl.
- (10 – 11): Encoding for rule C-Class.
- (12 – 20): Encoding for rule C-Subst. There is one specialized rule per constraint type.
- (21): Template for rule C-Prog. Will be instantiated based on the entailment declarations defined in the program.

1.2 Natural Numbers Program

$$\text{Zero}(x. \epsilon) \quad (22)$$

$$\text{Succ}(x. x.p :: \text{Nat}) \quad (23)$$

$$\forall x. x :: \text{Zero} \Rightarrow x :: \text{Nat} \quad (24)$$

$$\forall x. x :: \text{Succ}, x.p :: \text{Nat} \Rightarrow x :: \text{Nat} \quad (25)$$

$$\text{prev}(x. x :: \text{Nat}) : [y. y :: \text{Nat}] \quad (26)$$

$$\text{prev}(x. x :: \text{Zero}) : [y. y :: \text{Nat}] := \text{new Zero}() \quad (27)$$

$$\text{prev}(x. x :: \text{Succ}, x.p :: \text{Nat}) : [y. y :: \text{Nat}] := x.p \quad (28)$$

1.3 C-Prog Rules for Natural Numbers Program

Create C-Prog rules based on (24) and (25).

$$\forall a : \mathcal{B}, p : \text{Path}. \quad (29)$$

$$(a \rightarrow p :: \text{Zero}) \rightarrow \quad (30)$$

$$(a \rightarrow p :: \text{Nat}) \quad (31)$$

$$\forall a : \mathcal{B}, p : \text{Path}. \quad (32)$$

$$(a \rightarrow p :: \text{Succ} \wedge x.p_{\llbracket x \mapsto p \rrbracket} :: \text{Nat}) \rightarrow \quad (33)$$

$$(a \rightarrow p :: \text{Nat}) \quad (34)$$

2 Example Entailments

2.1 Working valid entailment

$$p.\text{cls} \equiv \text{Zero} \vdash p :: \text{Nat}$$

- Checks unsatisfiable
- Unsat Core: C-Class, C-Prog-Zero

2.2 Working invalid entailment

$$\cdot \vdash x \equiv y$$

- Checks satisfiable
- Model: $p \equiv q \doteq p = q$

$$a \equiv b \vdash a \equiv c$$

Checks satisfiable

Model:

```

helper(q:Path) :=
  q = a ? a :
    q = c ? c :
      q = x ? x :
        q = b ? b :
          q = b.p ? b.p :
            q = a.b ? a.b : c.p
p:Path ≡ q:Path :=
  let a1 := helper(p) = a.p ∧ helper(q) = b.p
    a2 := helper(p) = a.p ∧ helper(q) = a.p
    a3 := helper(p) = c.p ∧ helper(q) = c.p
    a4 := helper(p) = b.p ∧ helper(q) = b.p
    a5 := helper(p) = b.p ∧ helper(q) = a.p
  in ⋁i ∈ {j | 1 ≤ j ≤ 5} ai
  ∨ helper(p) = a ∧ helper(q) = a
  ∨ helper(p) = b ∧ helper(q) = b
  ∨ helper(p) = b ∧ helper(q) = a
  ∨ helper(p) = c ∧ helper(q) = c
  ∨ helper(p) = x ∧ helper(q) = x
  ∨ helper(p) = a ∧ helper(q) = b

```

2.3 Non-working invalid entailment

$x :: \text{Succ}, x.p :: \text{Zero} \vdash x :: \text{Zero}$

- Location: /paper/dep-classes/smt/semantic_entailment/fieldAccessTimeout.smt
- Solver has “infinite” runtime.
- Wanted behavior: Checks satisfiable.
- Current Solution: Impose a timeout on the solver.
 - Assume an entailment to be invalid if the solver times out (to retain soundness).
 - The system isn’t complete anymore.

- Balance the timeout between the amount of checkable valid entailments and tolerable waiting time. (Set it such that the majority of valid entailments can still be checked.)

3 Detailed look at infinite runtime example

3.1 Formulae generated for 2.3

$x :: \text{Succ}, x.p :: \text{Zero} \vdash x :: \text{Zero}$

$$\text{Variable} := \{x\} \quad (35)$$

$$\text{Field} := \{p\} \quad (36)$$

$$\text{Class} := \{\text{Zero}, \text{Succ}, \text{Nat}\} \quad (37)$$

$$\text{Path} := ((\text{Variable}) (\text{Path}.\text{Field})) \quad (38)$$

$$\forall p:\text{Path}. p \equiv p \quad (39)$$

$$\forall a:\mathcal{B}, p:\text{Path}, c:\text{Class}. \quad (40)$$

$$(a \rightarrow p.\text{cls} \equiv c) \rightarrow (a \rightarrow p :: c) \quad (41)$$

$$\forall a:\mathcal{B}, p:\text{Path}, q:\text{Path}, r:\text{Path}, s:\text{Path}, x:\text{Variable}. \quad (42)$$

$$(a \rightarrow p\llbracket x \mapsto r \rrbracket \equiv q\llbracket x \mapsto r \rrbracket \wedge (a \rightarrow s \equiv r)) \rightarrow \quad (43)$$

$$(a \rightarrow p\llbracket x \mapsto s \rrbracket \equiv q\llbracket x \mapsto s \rrbracket) \quad (44)$$

$$\forall a:\mathcal{B}, p:\text{Path}, c:\text{Class}, r:\text{Path}, s:\text{Path}, x:\text{Variable}. \quad (45)$$

$$(a \rightarrow p\llbracket x \mapsto r \rrbracket :: c \wedge (a \rightarrow s \equiv r)) \rightarrow \quad (46)$$

$$(a \rightarrow p\llbracket x \mapsto s \rrbracket :: c) \quad (47)$$

$$\forall a:\mathcal{B}, p:\text{Path}, c:\text{Class}, r:\text{Path}, s:\text{Path}, x:\text{Variable}. \quad (48)$$

$$(a \rightarrow p\llbracket x \mapsto r \rrbracket.\text{cls} \equiv c \wedge (a \rightarrow s \equiv r)) \rightarrow \quad (49)$$

$$(a \rightarrow p\llbracket x \mapsto s \rrbracket.\text{cls} \equiv c) \quad (50)$$

$$\forall a:\mathcal{B}, p:\text{Path}. (a \rightarrow p :: \text{Zero}) \rightarrow (a \rightarrow p :: \text{Nat}) \quad (51)$$

$$\forall a:\mathcal{B}, q:\text{Path}. (a \rightarrow q :: \text{Succ} \wedge x.p\llbracket x \mapsto q \rrbracket :: \text{Nat}) \rightarrow (a \rightarrow q :: \text{Nat}) \quad (52)$$

$$\neg(x :: \text{Succ} \wedge x.p :: \text{Zero} \rightarrow x :: \text{Zero}) \quad (53)$$

3.2 Formulae generated for alpha renamed 2.3

$a :: \text{Succ}, a.p :: \text{Zero} \vdash a :: \text{Zero}$

$$\text{Variable} := \{x, a\} \quad (54)$$

$$\text{Field} := \{p\} \quad (55)$$

$$\text{Class} := \{\text{Zero}, \text{Succ}, \text{Nat}\} \quad (56)$$

$$\text{Path} := ((\text{Variable}) (\text{Path}.\text{Field})) \quad (57)$$

$$\forall p:\text{Path}. p \equiv p \quad (58)$$

$$\forall a:\mathcal{B}, p:\text{Path}, c:\text{Class}. \quad (59)$$

$$(a \rightarrow p.\text{cls} \equiv c) \rightarrow (a \rightarrow p :: c) \quad (60)$$

$$\forall a:\mathcal{B}, p:\text{Path}, q:\text{Path}, r:\text{Path}, s:\text{Path}, x:\text{Variable}. \quad (61)$$

$$(a \rightarrow p\llbracket x \mapsto r \rrbracket \equiv q\llbracket x \mapsto r \rrbracket \wedge (a \rightarrow s \equiv r)) \rightarrow \quad (62)$$

$$(a \rightarrow p\llbracket x \mapsto s \rrbracket \equiv q\llbracket x \mapsto s \rrbracket) \quad (63)$$

$$\forall a:\mathcal{B}, p:\text{Path}, c:\text{Class}, r:\text{Path}, s:\text{Path}, x:\text{Variable}. \quad (64)$$

$$(a \rightarrow p\llbracket x \mapsto r \rrbracket :: c \wedge (a \rightarrow s \equiv r)) \rightarrow \quad (65)$$

$$(a \rightarrow p\llbracket x \mapsto s \rrbracket :: c) \quad (66)$$

$$\forall a:\mathcal{B}, p:\text{Path}, c:\text{Class}, r:\text{Path}, s:\text{Path}, x:\text{Variable}. \quad (67)$$

$$(a \rightarrow p\llbracket x \mapsto r \rrbracket.\text{cls} \equiv c \wedge (a \rightarrow s \equiv r)) \rightarrow \quad (68)$$

$$(a \rightarrow p\llbracket x \mapsto s \rrbracket.\text{cls} \equiv c) \quad (69)$$

$$\forall a:\mathcal{B}, p:\text{Path}. (a \rightarrow p :: \text{Zero}) \rightarrow (a \rightarrow p :: \text{Nat}) \quad (70)$$

$$\forall a:\mathcal{B}, q:\text{Path}. (a \rightarrow q :: \text{Succ} \wedge x.p\llbracket x \mapsto q \rrbracket :: \text{Nat}) \rightarrow (a \rightarrow q :: \text{Nat}) \quad (71)$$

$$\neg(a :: \text{Succ} \wedge a.p :: \text{Zero} \rightarrow a :: \text{Zero}) \quad (72)$$

3.3 Get rid of encoding x as a enumerable variable by directly substituting with variable path, or by adding quantified variable to C-Prog rules

4 Undefinedness

4.1 Add expert knowledge to successfully check 2.3

The solver is able to check the example satisfiable if we either

- add $\neg x \equiv x.p$ to the context, resulting in $x :: \text{Succ} \wedge x.p :: \text{Zero} \wedge \neg x \equiv x.p \rightarrow x :: \text{Zero}$ or
- additionally assert $\neg x \equiv x.p$.

4.2 Asserting two mutually exclusive classes to the same path

Asserting both $x :: \text{Zero}$ and $x :: \text{Succ}$ in the solver yields SAT.

This, at first, seems to be unintended behaviour. In reality, this is not the kind of problem we want to solve with the encoding. What we ask of the solver

is if there exists a conflict between the entailment to check (context implies conclusion) and the asserted calculus rules.

In other words: If the entailment context allows this to be true, it is not a problem of the encoding.

5 Faithful encoding

As concluded in 4.2, we want the system to answer the question: “does the entailment conform to the calculus rules” or in other words: “does the negation of the entailment contradict the calculus rules”. Therefore the fact that it is allowed for a path to be an instance of two mutually exclusive classes (e.g. two classes that are not in a subtype relation), is non-problematic as long as the entailment context doesn’t explicitly forbid this.
